

## **An innovative product for ageing eyes**

This latest anti-ageing breakthrough is a special form of Carnosine, called N-acetylcarnosine, a natural antioxidant, that has achieved remarkable results in clinical trials. Dr Babizhayev, who headed the Russian research team (Innovative Vision Products - IVP) that developed this ground breaking treatment, has stated that the maximum obtainable results are usually achieved in a 3 to 5 month period, however there are often noticeable benefits within only 1 month.

Marios Kyriazis, M.D. has written a booklet on the subject. In it he states that the research highlights that quality and formula are essential to both efficacy and long-term safety. To ensure that you are purchasing an officially approved and tested product, the packaging should clearly state that it is approved by IVP.

**Can-C eye drops are the world's first N-acetylcarnosine eye-drop to meet the strict criteria laid down by IVP and is therefore officially approved by IVP.**

Can-C eye-drops are sold as an eye-lubricant, but are being used in parts of the world for other eye problems as well. They are safe to be used by most people, including those with cataracts.

We are delighted that a unique, new and patented formula has been developed by IVP, (the inventors of Can-C). The new formula is called Can-C Plus capsules and its synergistic combination of ingredients provides an environment for Can-C eye-drops to be even more beneficial. **When used together, these two products provide maximum benefit.**
